

#### **MULTI-FUNCTION AUTO-CONTROL VALVE**

- ► Controller is fixed directly and designed of non-controller conduit. It reduces the damage of the controller conduit while transporting the equipment.
- ▶ Controller is designed to be quickly screw fastened, enabling fast and easy installation.
- ▶ The valve body can match with all types of controller without technical conversion, and all kinds of control valves can be formed.
- ▶ Cylinder design is adopted for the valve body structure, making the valve applicable to low and high pressure in both vertical and horizontal positions.
- ▶ Straight flow path is designed inside valve body. The large flow can reduce the malfunctions caused by impure water and effectively decrease turbulence and related bad effects.
- The valve body is shaped and formed as whole. Small volume, lightweight, and easy installation. Simple and elegant appearance.
- Professional manufacturers, best quality, and reasonable price.

▶ Patent Number: 135517

- 1. Applied conditions: Fluid & Air
- 2. Applied temperature: -15° ~ 80°C
- 3. Connection ends: Available for all international standards
- 4. Materials of valve body: Cast Iron, Ductile Iron, Bronze & Stainless Steel

The valve body of main valve becomes functional by an inlet-guiding hole. This hole transfers pressure to pressure chamber. When enough pressure accumulates in the pressure chamber, it generates pushing force that makes the piston close to valve seat and generates the closing motion. There is another outlet guiding hole inside the pressure chamber. When the hole is open, pressure in pressure chamber dissipates and valve gate is pushed open by incoming water pressure.

## FLOAT VALVE

Float valve uses a sub-valve (float valve switch) to control the main valve. When the water level elevates to the full water level set by sub-valve ( float valve switch) ,the sub-valve (float valve switch) closes and the back pressure chamber inside the main valve accumulates pressure rapidly, which reversely pushes the piston valve to close. By this mechanism, the float valve can thus control the water level. In order to save space inside the pool and for easy maintenance, it is recommended to install the float valve outside the pool.

- the pressure chamber and pushes the gate reversibly.
- OAt full water level, pressure accumulates in OAt low water level, pressure in pressure chamber dissipates, and water pressure inside the pipe pushes the gate open.
  - ▶ The working pressure should be greater than 0.3 kgf/cm² and gate fully open with 1.5 kgf/cm², please check the pressure before installation.
  - Please remove impurities or metal dusts inside the pipe thoroughly. If possible, please add filter to prevent pipe blocking.
  - ▶ Vertical and horizontal installation is acceptable. Avoid upside-down installation under insufficient flow.
  - Float ball size is 4", and the connection end is 1/2" PT Thread (Max. Pressure 10 kgf/cm2).

## SOLENOID CONTROL VALVE

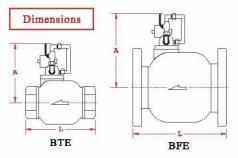

Solenoid control valve is a kind of isolation valve, which can substitute traditional gate valves, ball valves and butterfly valves. The gate functioning is easily controlled by electrical power. The valve can be installed in fire control facility, water supply, or distant location where it's difficult to control the gate opening. The controller is directly fixed and can be easily installed on piping site. Interchangeable between manual and solenoid control.

- Specification of Solenoid Control Switch
  - ► Working Voltage: DC12V, DC24V, AC110V/220V, 50/60Hz
  - ► Electrifying Time Range:

1 year continuously for 10,000 hours

- ▶ Allowable Voltage Range: ±10%
- ► Applied Temperature : -15 ~ 80°C
- ▶ Durability: 500,000 Cycles
- ► Applied Pressure Range: 0.3 ~ 10 kgf/cm<sup>2</sup>
- ► Generally NC type (open when switch on), special order is needed for NO type (close when switch off).
- ▶ The working pressure should be greater than 0.3 kgf/cm² and gate fully open with 1.5 kgf/cm², please check the pressure before installation.
- ▶ Please remove impurities or metal dusts inside the pipe thoroughly. If possible, please add filter to prevent pipe blocking.
- Avoid upside-down installation under insufficient flow. (Valve's inlet should face up when it is installed)

## PRESSURE REDUCING VALVE

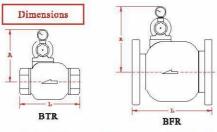

- Pressure reducing valve can prevent pipeline breakage due to high pressure.
- ▶ Pressure reducing valve is installed in water supply pipeline and maintains the setting outlet pressure in main valve, regardless of the different inlet pressure.
- ▶ Pressure reducing valve can be installed in water supply, air conditioning and fire control systems to maintain the setting outlet pressure.

The pressure reducing valve uses a sub-valve (pressure reducing pilot valve) to control the main valve. When the outlet pressure reaches the setting range of pressure reducing pilot valve, the pilot valve will automatically sense the outlet pressure and adjust the pressure of the back pressure chamber in the main valve, so the valve gate can be opened and consequently maintains the outlet pressure.

- ▶ Pressure Adjusting Range : 1 ~ 7 kgf/cm² (1 kgf/cm² = 14.2 psi) 4 ~ 12 kgf/cm²
- Special order can be arranged for higher pressure adjustment range.
- ▶ The pressure meter on the rilot valve shows the outlet pressure. When the outlet opens, the value of the pressure meter is lower.
- ▶ When the outlet is used for large flow and the gate generates quick-close motion, the pilot valve will slowly respond to the main valve to close the gate. Under this situation, the outlet pressure gets a little higher, and a tiny pressure reducing valve can be added.

## PRESSURE RELIEF VALVE

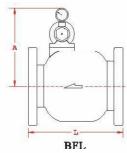

- ▶ Pressure relief valve is installed on the outlet pipe of water supply pipeline. It can maintain safe water supply pressure inside the pipe and prevent pipeline and equipment damage caused by accidental escalation of water pressure.
- ▶ When water pump stops functioning or pipeline gate suddenly closes, abnormal pressure forms inside the pipe. As the pressure gets over a certain safety limit, pressure relief valve can open automatically and releases the water pressure above the safety limit, so as to ensure the safety of pipeline and equipment. When the pressure turns back within the safety limit, the pressure relief will close slowly.

- ► Pressure Adjusting Range :  $0.2\sim4 \text{ kgf/cm}^2$ (1 kgf/cm<sup>2</sup> = 14.2 psi) 2  $\sim8 \text{ kgf/cm}^2$ 5  $\sim13 \text{ kgf/cm}^2$
- ▶ The working pressure should be greater than 0.3 kgf/cm² and gate fully open with 1.5 kgf/cm², please check the pressure before installation.
- Special order can be arranged for higher pressure adjustment range.

#### Flow Chart of Pressure Relief Valve

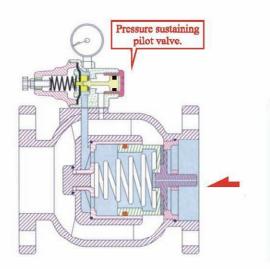

## PRESSURE SUSTAINING VALVE

- ▶ Pressure sustaining valve is utilized when installing pipes for users. It primarily matches up with the minimum working pressure inside the tap water pipe, balancing up-stream and down-stream pressure during normalcy and emergency, and maintains constant pressure inside the pipe.
- ▶ Pressure sustaining valve can sustain the maximum working pressure inside the pipe when installed in water supply areas.
- ► Pressure adjusting range :0.2~4 kgf/cm² (1 kgf/cm²=14.2 psi) 3~10 kgf/cm²
  - The working pressure should be greater than 0.3 kgf/cm<sup>2</sup> and gate fully open with 1.5 kgf/cm<sup>2</sup>, please check the pressure before installation.

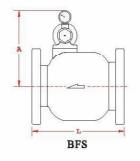

Tap Water Supply System:

Pressure sustaining valve is utilized when installing pipes for users. It primarily matches up with the minimum working pressure inside the tap water pipe, balancing up-stream and down-stream pressure during normalcy and emergency, and maintains constant pressure inside the pipe.
