

PROCESS AND STERILE FILTRATION

AIR AND GAS TREATMENT

Since 1988 OMEGA AIR is developing and manufacturing quality solutions for treatment of industrial as well as process air and gas. Due to constant investment in research and development and in new production technologies we can offer one of the most comprehensive ranges of products for general purpose process filtration, steam filtration, sterile filtration and sterile ventilation of tanks.

TYPICAL APPLICATIONS

- Aseptic processing
- Aseptic packaging
- PET bottle blowing
- Moving ingredients
- Tank ventilation
- General filtration applications
-

TYPICAL INDUSTRIES

- Food and Beverage
- Pharmaceutical / Biopharmaceutical
- Electronics / Semiconductor
- Medical / Health care
-

CONVENTIONAL COMPRESSED AIR SYSTEM

In process industry purity requirements for air/gas are usually higher or at least different compared to purity requirements for standard industrial applications. Production of compressed air in process industry usually starts in conventional compressed air system with standard equipment for treatment of industrial compressed air/gas. At certain point there is a switchover from industrial to process filtration and from this point on different materials and filtration procedures are applied.

LEGEND

- 1 compressor
- 2 condensate separator
- 3 pressure vessel
- 4 compressed air dryer
- 5 condensate drain
- 6 filter
- 7 activated carbon tower
- 8 oil/water separator

STERILE AND PROCESS AIR APPLICATIONS	2	1-3	0/1
--------------------------------------	---	-----	-----

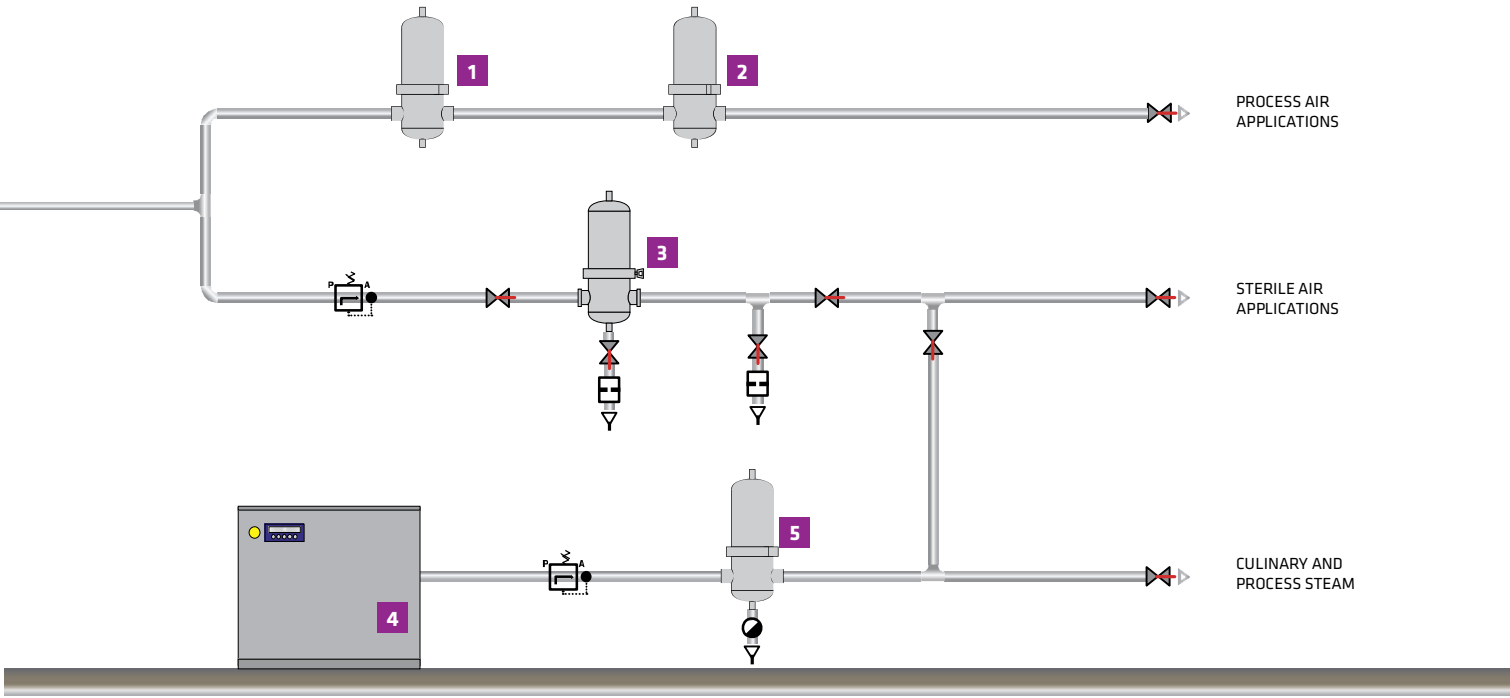

PROCESS AIR/GAS SYSTEM

Due to contaminants such as solid particles, moisture, hydrocarbons or bacteria compressed air/gas when used in process can harm and cause quality and efficiency problems. Applications in process industry require compressed air or gas where above mentioned contaminants are removed or reduced to acceptable level for specific application.

LEGEND

- 1 stainless steel process filter, PN filter element
- 2 stainless steel process filter, PPF filter element
- 3 stainless steel sterile filter, VSF filter element
- 4 steam generator
- 5 steam filter, PIW filter element

VENTILATION OF TANKS

During filling and emptying of tank with liquid ambient air is being vented in and out of the tank. In order not to harm the process by letting contaminants from ambient into the tank "air-vent" filters (AV series) are installed on the top of the tank. Inside is filter element (AVF) which is designed to intercept any potential particulate or aerosol contaminants including bacteria.

LEGEND

- 1 Tank (pressure vessel)
- 2 AV filter

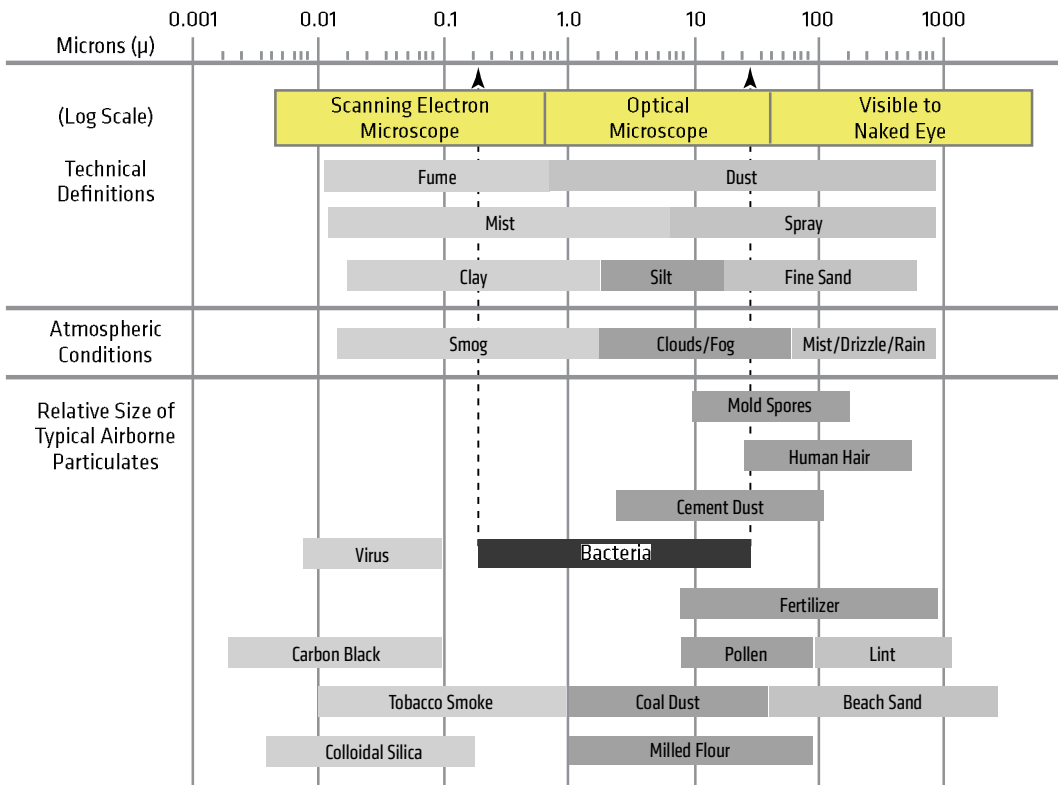

WHAT IS STERILE AIR

In process filtration applications “sterile” refers to “free from live bacteria or other microorganisms”.

SIZE OF BACTERIA

Size Comparison Chart

HOW TO PRODUCE STERILE AIR

To produce sterile air proper sterile filter needs to be installed (e.g. SF filter housing with VSF filter element) to filter out / intercept bacteria. It is essential that air on the inlet side of sterile filter is adequately prefiltered upstream and that complete “sterile filter installation” is sterilized regularly. Sterilization is required because intercepted bacteria can colonize in the surface of filter media and begin to grow/migrate through filter media. Two most common types of sterilization are:

STERILIZATION IN PLACE (SIP) where filter or even larger segments of installation are sterilized with stream of steam flowing through complete filter installation. This procedure is done in place of use without removing any parts from the installation.

AUTOCLAVE sterilization where filter element or in some cases even complete filter housing is removed from installation and sterilized in autoclave. Autoclave is a device used to sterilize products by subjecting them to high pressure saturated steam.

Frequency of sterilization depend on specific application requirements.

STERILIZATION IN PLACE PROCEDURE

Usually every process or application has specific operating requirements and also sterilization is then performed in accordance with this specific requirements.

Cumulative steaming time:

- 121 °C/250 °F, Sterilization 30 min, Heating and cooling 30 min (100 cycles)
- 132 °C/270 °F, Sterilization 20 min, Heating and cooling 40 min (100 cycles)
- 143 °C/290 °F, Sterilization 10 min, Heating and cooling 50 min (100 cycles)

AV SERIES

STAINLESS STEEL AIR VENTING FILTER

operating pressure	1 bar
volume flow rate	9 to 310 Nm ³ /h
body connections	DIN11851 (milk pipe conn.)
operating temp. range	up to 200 °C
material	stainless steel 1.4301 other types on request
surface	Ra 0.8

DESCRIPTION

AV stainless steel filter housings are designed to remove impurities from air which is being feed or exhausted from tank during changing of liquid level.

To meet the required air quality appropriate filter element (typically AVF filtration grade) must be installed into filter housing.

AV filter housing is also designed for sterilisation. Before use, if needed for the application, sterilize the filters.

- material: stainless steel 1.4301; on request 1.4404.
- replace filter element at least every 12 months or follow instructions for specific application.

-TRI-CLAMP connection on request.
